Lipids and lipoproteins in CKD

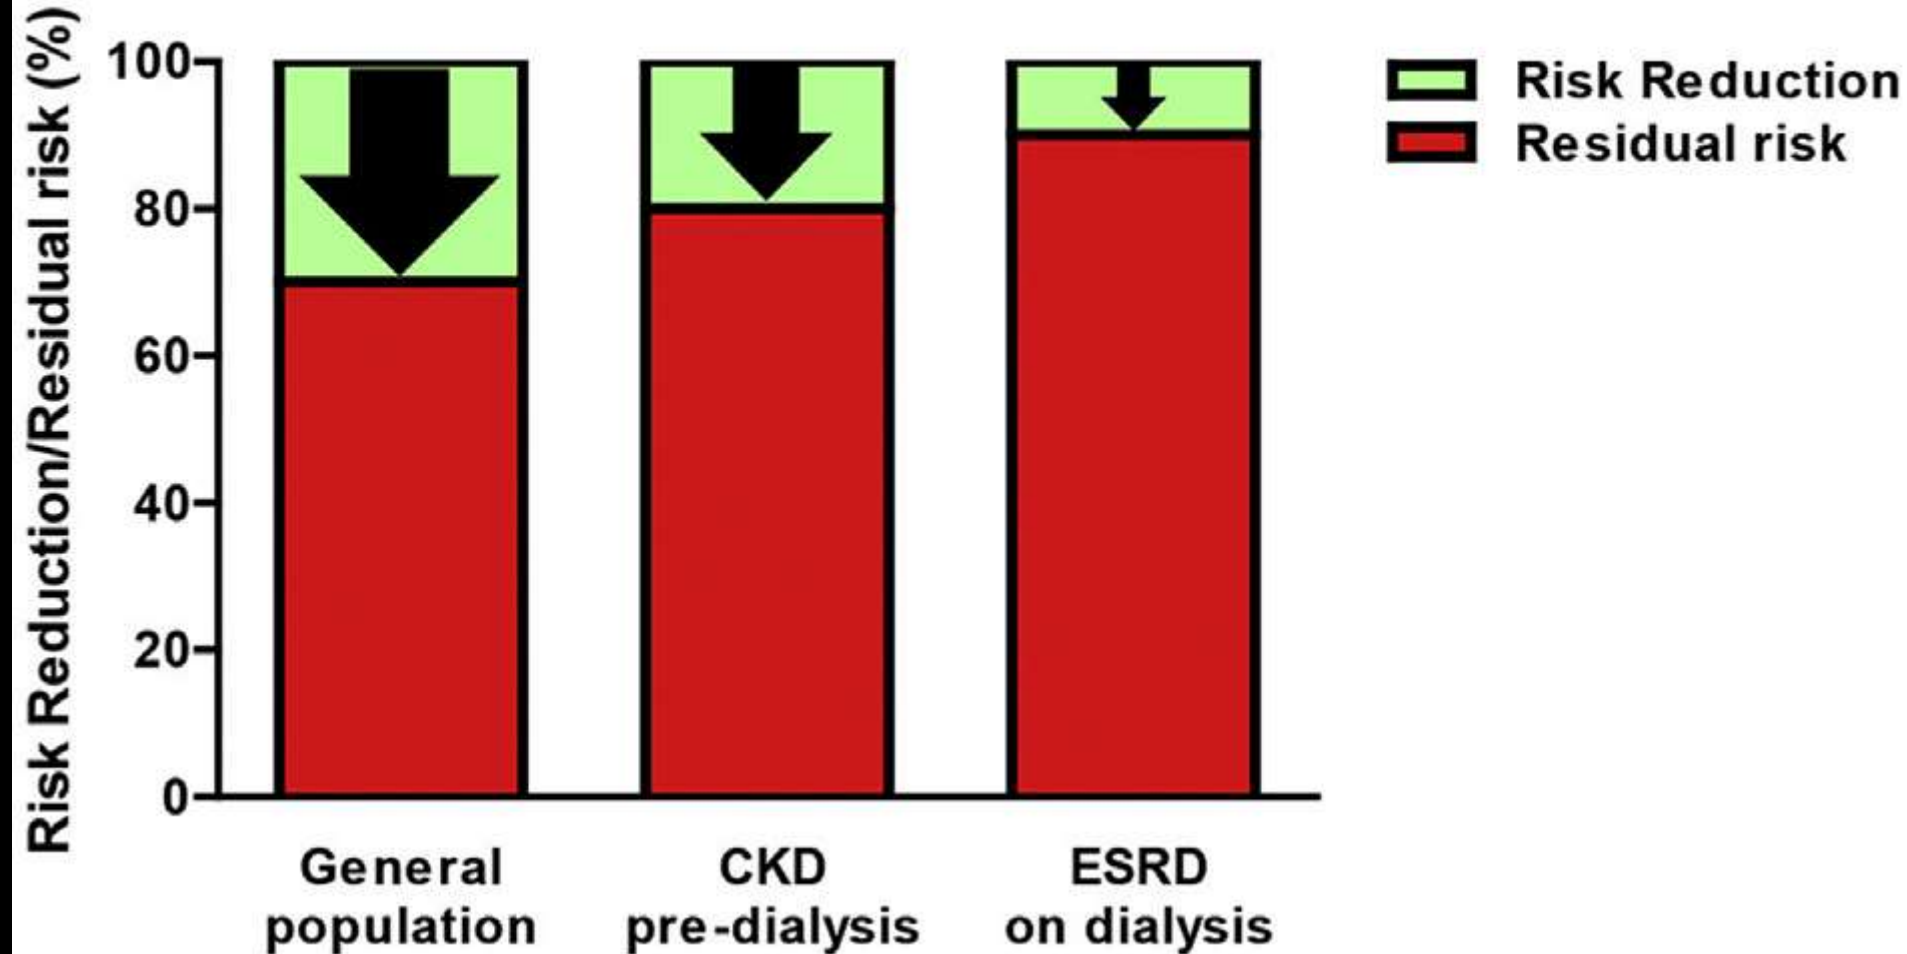

Table 1. Lipid and apolipoprotein profile across CKD

	Pre-dialysis CKD	Nephrotic syndrome	Hemodialysis	Peritoneal dialysis
Total cholesterol	→ ↑	↑ ↑	→ ↓	↑
LDL cholesterol	→ ↑	↑ ↑	→ ↓	↑
Small dense LDL	↑	↑	↑	↑
ApoB	→	↑ ↑	↓ → ↑	↑
HDL	↓	→ ↓	↓	↓
Triglyceride	↑	↑	↑	↑ ↑
Lp(a)	→ ↑	↑ ↑	↑	↑ ↑
ApoA-I	→ ↓	→ ↑	↓	↓

CKD, chronic kidney disease; LDL, low-density lipoprotein.

HDL-C levels are an independent predictor of the progression of chronic kidney disease

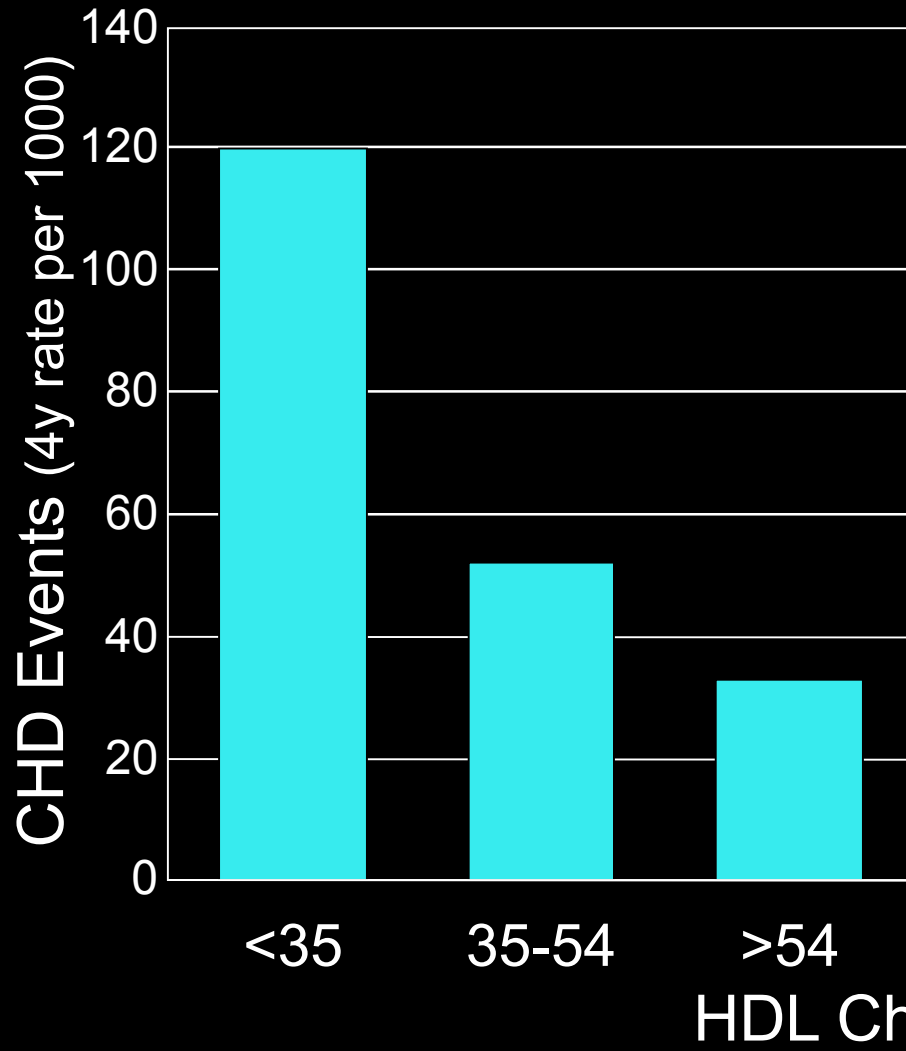

1st quartile: <40 mg/dl
2nd quartile: 40-48 mg/dl
3rd quartile: 48-60 mg/dl
4th quartile: ≥ 60 mg/dl

The events considered were for panel (a) doubling of creatinine levels and/or entry on dialysis; and for panel (b) GFR reduction by at least 50% and/or entry on dialysis.

HDL Metabolism and Antiatherogenic Cholesterol Transport

Lecithin:Cholesterol Acyltransferase

- 63-65 kD monomeric glycoprotein
- gene mapped to chromosome 16q22
- consists of 6 exons encoding a protein of 440 residues
- mature plasma protein: 416 aa
- 6 cysteines, Cys³¹ and Cys¹⁸⁴ are free
- 4 N-glycosylation and 2 O-glycosylation sites
- synthesized in the liver (and brain, testes)
- circulates in plasma reversibly bound to HDL (and LDL)
- average plasma levels: ~5 µg/ml
- esterifies cholesterol in biological fluids
